

PFL 2026 — Betting GTM Deck

The reference version of the PFL 2026 Go-To-Market deck, focused on the **betting partner pitch**.

Live reference: <https://pfl-2026.github.io/GTM/>

What this project is

This Claude Project pins the **betting GTM deck** — the master reference version. Everything attached (the `index.html`, all the images, logos, videos) is your source material.

IMPORTANT

You are **not editing this version directly**. You're forking it to create **your own tailored version** — for a specific partner pitch, region, or audience.

Think of the pinned deck as your starting block. Your job is to make it yours.

How chats work

When you open this project and start a chat, **the chat is private to you**. Each chat is your own working session — Claude reads the pinned deck as the starting point, and you steer it from there.

Pro tip: Start a new chat for each version you're building. Rename it (click the title at the top) to something like *"DraftKings pitch"* or *"MENA region cut"* so it's easy to find later.

Making your own version

The 6-step flow

Step	What to do
1	Open this project in Claude.ai
2	Start a new chat
3	Tell Claude what you need (examples below)
4	Claude returns an updated <code>index.html</code> + full <code>PFL-2026.zip</code>
5	Download both files
6	Deploy to your hosting (GitHub Pages or Azure — see below)

What good prompts look like

"Make a version of this deck for the DraftKings pitch — replace the betting stats with their relevant numbers, swap the cover image, and update the partner logos slide"

"Create a MENA-focused version — emphasise the regional broadcasters and the Riyadh event"

"Build a shorter 8-slide cut focused on the fan demographic story"

Deploy to GitHub Pages

Free · Simple · Auto-deploys on commit

One-time setup (your first version)

1. Go to github.com and sign in (free account if you don't have one)
2. Click **New** to create a repository
3. Name it (e.g. `pfl-draftkings-pitch`)
4. Set to **Public** (required for free GitHub Pages)
5. Tick **Add a README file**, click **Create repository**
6. Click **Settings** → **Pages** (left sidebar)
7. Under **Build and deployment**:
8. Source: **Deploy from a branch**
9. Branch: **main**
0. Folder: **/ (root)**
1. Click **Save**

Your repo is ready. Your live URL will be: `https://[your-username].github.io/[repo-name]/`

Uploading your deck

1. Download `PFL-2026.zip` from Claude, unzip it
2. In your repo, click **Add file** → **Upload files**
3. Drag the **contents** of the unzipped folder (`index.html` + `assets` folder) into the upload area
4. Type a commit message → click **Commit changes**
5. Wait ~30 seconds → visit your live URL → **Live**

Updating later

When Claude sends you a new version:

1. In your repo, click `index.html` → **pencil icon** to edit
2. Open the new `index.html` from Claude in any text editor → select all → copy
3. In GitHub editor, select all → paste over existing content
4. Commit message → **Commit changes**
5. Live in ~30 seconds

If asset files (images, videos) also changed, repeat the **Upload files** step and overwrite the existing ones.

Deploy to Azure Static Web Apps

Use this if: you're already on Azure or need integration with Microsoft 365 / Entra ID **Free tier** available

One-time setup

1. Go to portal.azure.com and sign in
2. Search **Static Web Apps** → click **Create**
3. Fill in:

Field	Value
Subscription	Your Azure subscription
Resource Group	Create new (e.g. <code>pfl-decks</code>)
Name	Descriptive (e.g. <code>pfl-draftkings-pitch</code>)
Plan type	Free
Region	Closest to you
Deployment source	GitHub (recommended) or Other

1. Click **Review + create** → **Create**
2. Wait ~1 minute for deployment
3. Click **Go to resource** → you'll see your live URL (e.g. `https://nice-water-12345.azurestaticapps.net`)

Option A — Deploy from GitHub (*recommended*)

If you've also got a GitHub repo, or you want git-based version history:

1. During Azure setup, set **Deployment source** to **GitHub**
2. Authorise Azure to read your GitHub account
3. Pick your repo and the `main` branch
4. **App location:** `/`
5. **Output location:** *leave blank*
6. Azure now auto-deploys every time you push to GitHub

Option B — Direct upload (*no GitHub*)

If you don't want a GitHub repo:

1. In your Static Web App resource → **Deployment** → **Manual deployments**
2. Click **Upload** → select your unzipped folder
3. Wait ~1 minute → refresh your live URL

The GitHub-linked option is much easier to update later. Direct upload is fine for one-off pitches.

Other deploy options

Need something faster for a one-off?

Platform	Best for	Link

Netlify Drop	Instant drag-and-drop, no account needed	app.netlify.com/drop
Vercel	GitHub-integrated, similar to Netlify	vercel.com
Cloudflare Pages	Free, fast, GitHub-integrated	pages.cloudflare.com

All three: connect a repo or drag a folder, get a URL.

What's in the pinned deck

File / folder	What it is
<code>index.html</code>	The entire deck — one self-contained HTML file
<code>assets/logos/</code>	Cleaned transparent PFL + third-party logos (these load locally for proper transparency). All other broadcaster logos load from the live site
<code>assets/images/</code>	Backgrounds, content tiles, fighter / arena imagery (<i>loaded from live site</i>)
<code>assets/video/</code>	5 MP4 clips (<i>loaded from live site</i>)
<code>assets/fighters/</code>	Fighter photos (<i>loaded from live site</i>)

IMPORTANT

When you deploy your version, you **must** include the `assets/logos/` folder from the zip — these transparent versions are critical for the deck to look right. The other assets can come from the live site OR your own hosting.

House rules for asking Claude to edit

Keep your edits clean and predictable:

- **Be specific about which slide.** "Slide 4" > "the slide with the stats"
- **Quote the exact text** you want to change (copy-paste from the deck if you can't remember it)
- **For new images, upload directly into the chat or share a URL** — Claude can't grab from your desktop
- **Don't ask Claude to push to your repo.** It can't — you do the deploy yourself
- **Always ask for the full folder archive** if anything changed beyond the HTML

Brand & content rules

WARNING

These are non-negotiable to keep the deck on-brand.

- **PFL Navy:** `#052383` (set as CSS variable — don't override)
- **PFL Red:** `#FF0404` (set as CSS variable — don't override)
- **Fonts:** Bebas Neue (display) + Saira / Saira Condensed (body) — don't add new fonts without sign-off

- **Cite sources** for stats (e.g. "*Source: YouGov 2025*")
 - **Don't add real broadcaster/sponsor logos** unless the partnership is publicly announced
 - **Fighter photos** must come from the official PFL fighter database
-

Need help?

If something breaks or you're stuck, just tell Claude what you tried and what happened. Paste any error messages. Most issues fix in one or two turns.
